

# User Experience

And Feedbacks

This document contains screenshots of websites various functions being tested by general users who were chosen randomly.

## 1) Saving files with a file extension for viewing purpose.

This function was tested by Fahad Amin Quadery, a business student studying in University of Malaya.

- File Upload without file-type extension:

We can see that our image logo is not appearing, which means file is not online viewable.

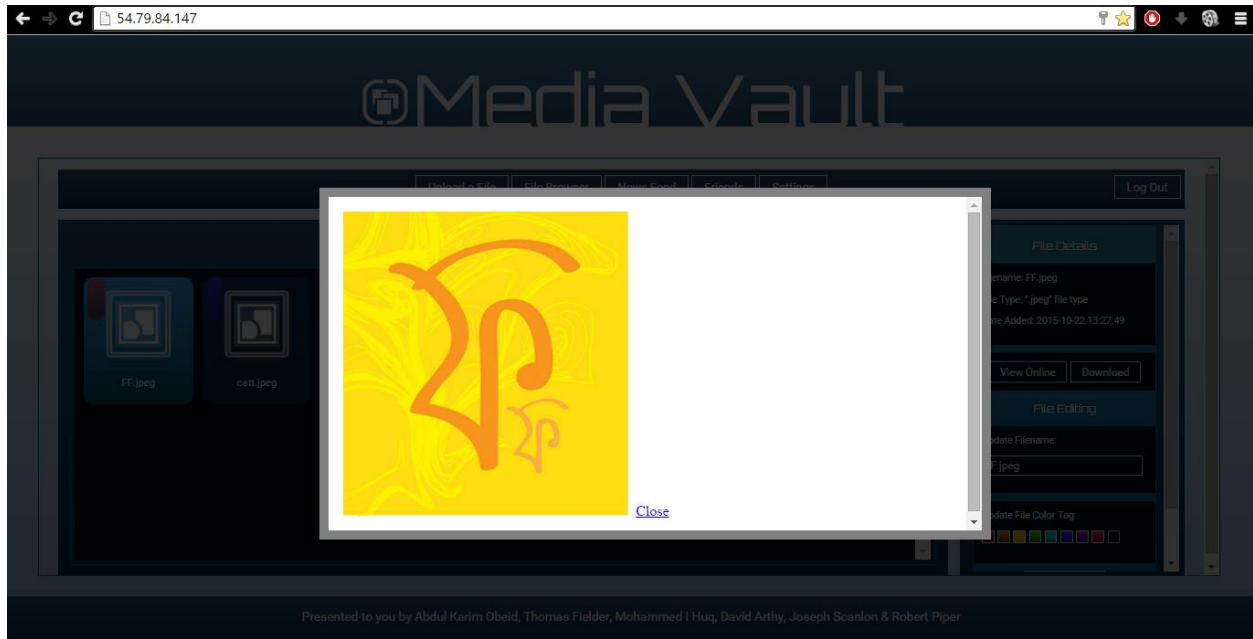

File viewing not working.

- File extension added.

After adding extension, we can see the changes in the thumbnails.

File is now viewable

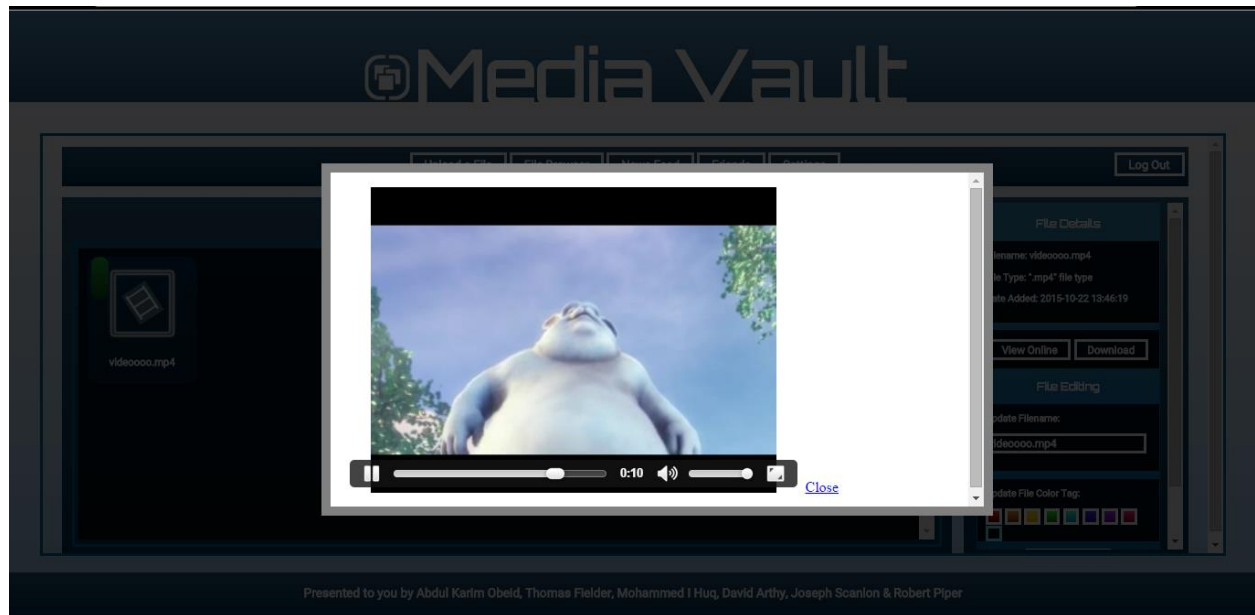

#### User Comment:

The idea and photo viewing are good. However, the some functions are complicated like the one with file extension. It would be preferable to have it auto set, and not being needed to worry about it. Color tag idea was good as well.

## 2) Playing HD Videos Online

This function was tested by Adam Lemmings, an exchange student at QUT studying Law.

- Playing HD video

Adam used a sample video which was HD quality. This has been an issue in the past as playing HD quality video was not successful in the past. However, this is working well now.

### User Comment:

It is kind of similar to dropbox but different interface. But, the friend list system made it unique. Color tag idea is different as well. Maybe adding a small frame for video streaming would be nice, instead of showing blank white area on the left.

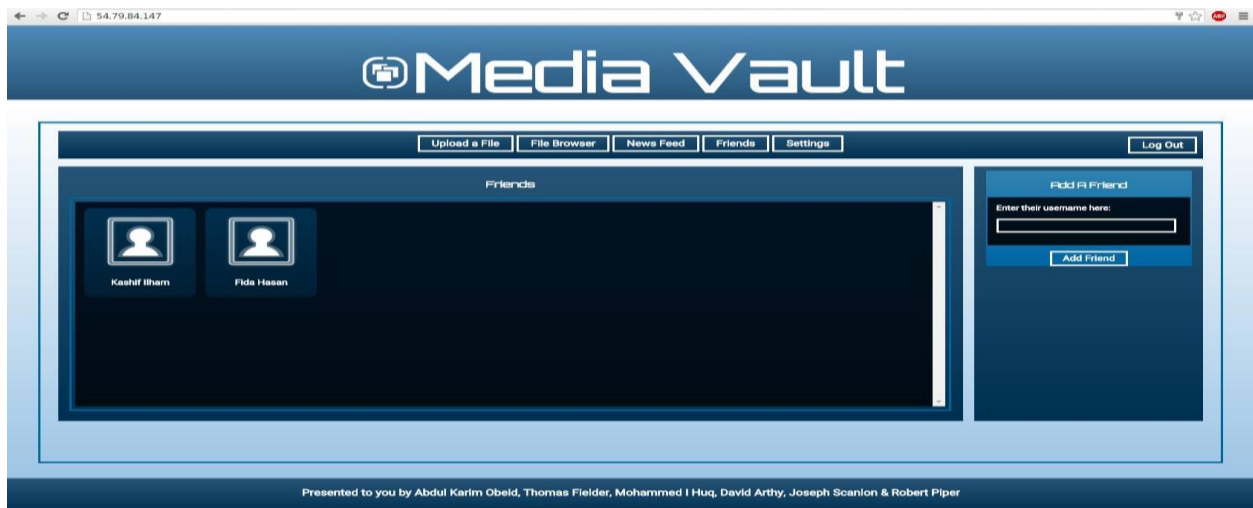

### 3) Friend Deletion

This function was tested by Md. Abul Bashar, a tutor in QUT.

- Selecting a friend for removal

- After friend removal

#### User Comment:

The interface and color combination is good. It is easy to use. Friends function is a unique implementation. However it would be better to have friend request instead of direct adding. Also asking for confirmation message would be a useful function.

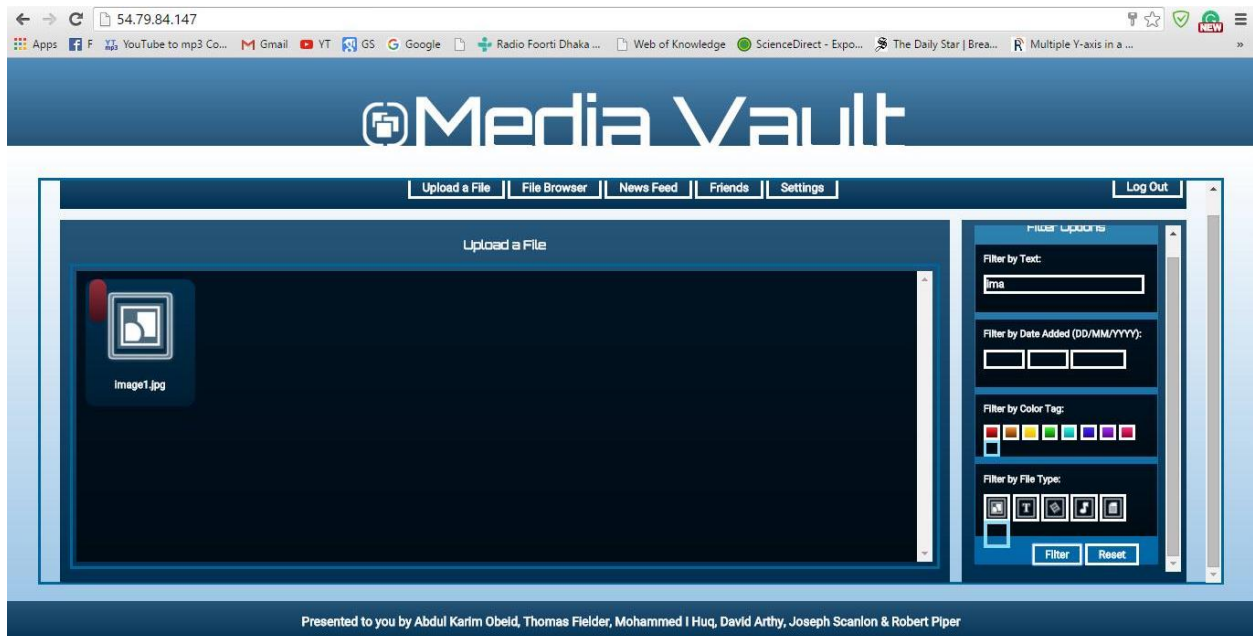

## 4) Search Engine Functions

This was tested by Mahmudur M Rahman, PHD student in QUT

- Before requesting a search

- Searching with keywords

- Searching by date(1)

- Searching by date (2)

### User Comment:

Nice interface with working functions. Search engine is really interesting with a lot of functions. Really good for categorizing and differentiating files. Overall with friend list function this website has potential to grow big and compete in the market.

## 5) Viewing Friend's Upload

This was tested by Fida Hasa, Research Assistant at QUT

- Selecting a friend

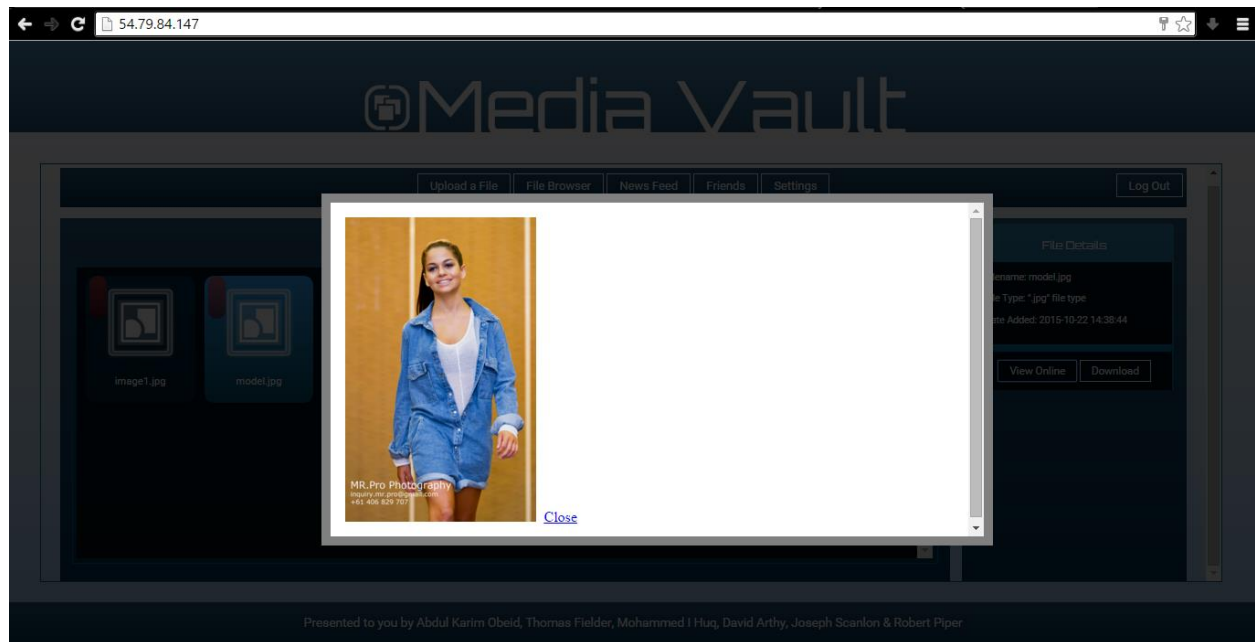

- Selecting one of his uploads

- View Online

#### User Comment:

Being able to add friends in a media vault website is good. Considering the rise of social media business, it can be said that it is necessary. Also, it is worth mentioning that it is much easier to watch friends uploads from his/her account rather than sharing link over e-mail. But, a bit security is necessary. Maybe an option to restrict users from viewing some files. Implementing some privacy from friends will be a good job.
